

Orasi Private Cloud Hosting for Mobile Labs

The Orasi Private Cloud Hosting service for Mobile Labs eliminates the need for customers to purchase, configure and maintain their own mobile devices. Orasi will install and configure all of the servers and devices necessary at the Orasi mobile hosting facility. Customers then access the Mobile Labs environment through a secure VPN connection, enabling both manual and automated testing against real mobile devices.

Since it's a private cloud option, all of the servers and devices are dedicated to the customer and available at any time. There is no security risk of other customers having access to the environment or sharing the devices. The secure VPN connectivity provides a dedicated channel by which any customer representative can access the devices from anywhere in the world.

Contract Term

The Orasi Private Cloud Hosting service is sold in conjunction with Mobile Labs DeviceConnect. The term of the hosting normally mirrors the DeviceConnect subscription. The standard term is for 1 year and is renewed annually, but there are other term options available. For perpetual licenses, the Orasi Private Cloud Hosting service is purchased as a one-year subscription and renewed annually.

During the term of the service, the equipment and software is dedicated to the customer. At the end of the term, the customer has the option to renew or cancel the subscription. If the customer chooses to renew the subscription, all existing equipment is retained and the device pool is reevaluated.

Devices

The mobile devices necessary can be provided by either Orasi or the customer. Orasi's standard hosting package includes two mobile devices of the customer's choosing for each concurrent DeviceConnect license. Additional devices can be added to the hosting package to create a customized library of mobile devices for development and testing.

All devices are working, physical mobile devices, not emulators. The customer can specify any combination of manufacturer, model and operating system version for each device. All devices include WiFi connectivity for access to the internet and can optionally be connected to a mobile carrier SIM contract (e.g., AT&T and Verizon) for voice, text, and data testing.

If a customer chooses to cancel the hosting service, Orasi will reset all hardware to factory condition and destroy any backup of customer data. At a customer's request, Orasi can physically destroy the mobile devices to ensure data privacy. If the mobile devices were provided by the customer, they will be returned within 30 days of contract termination.

Software Licenses

All required software licenses are provided by the customer unless otherwise specified. Orasi can arrange the purchase of the Mobile Labs subscription for the customer. Orasi also can bundle the cost of the appropriate licenses into the hosting service, if desired.
